

ABSTRACT OF THE DISCLOSURE

A pallet has a top deck member and a bottom deck member. The top deck member has an upper surface, and a lower surface defined by a plurality of first cross-rib members. The bottom deck member has an upper portion and runners extending downwardly therefrom in a unitary construction. The upper portion has an upper surface defined by a plurality of second cross-rib members which correspond to the first cross-rib members and securely attached to mount the top and bottom decks to each other. The runners have a lower surface and extend transversely across the pallet in a parallel orientation, and also have a plurality of upright members and support members extending between the upright members and integrally formed therewith in a unitary construction. The plurality of second cross-rib members extend generally vertically from the top deck to the lower surface of the runners.
